

Document Summary TASK-0C1EDFE7

Analysis & Generated Response

Certainly! Here's the code snippet provided in the document:

```
```python
Import necessary libraries
import requests
from bs4 import BeautifulSoup

Define the login URL
login_url = "https://example.com/login"

Prepare the data payload for the POST request
data = {
 'username': 'your_username',
 'password': 'your_password'
}

Send a POST request to the login page
response = requests.post(login_url, data=data)

Check if the login was successful
if response.status_code == 200:
 print("Login successful!")
else:
 print("Login failed. Please check your credentials.")
```
```

This code snippet demonstrates how to log in to a website using Python's `requests` library and BeautifulSoup for parsing HTML content. Make sure to replace `https://example.com/login`, `your\_username`, and `your\_password` with the actual login URL and credentials of the target website.
