Analysis & Generated Response

```
```python
```

```
def add_two_numbers(a: float, b: float) -> float:
```

```
 """
```

Adds two numbers a and b.

Parameters:

a (float): The first number.

b (float): The second number.

Returns:

float: The sum of the two numbers.

```
 """
```

```
 return a + b
```

```
Example usage
```

```
result = add_two_numbers(3.5, 2.7)
```

```
print(result) # Output: 6.2
```

```
```
```

This Python function `add\_two\_numbers` takes two parameters, `a` and `b`, both of which must be floats (or any other numeric type), and returns their sum as a float. The docstring provides a clear description of the function's purpose, parameters, and return value. The example usage demonstrates how to call the function with specific numbers and print the result.
