

Document Summary TASK-TESTPPT

Analysis & Generated Response

1. Executive Overview

- **Project Title:** Sovereign On-Premise Agentic AI Workbench using Open-Weight Multimodal LLMs for Confidential Industrial Work

- **Event/Initiative:**

Smart India Hackathon 2026

- **Problem Statement ID:** SIH26117
- **Team Name:** TEAM ADRESTIA
- **Core Mission:** To develop a sovereign on-premise AI workbench that addresses the challenges of confidential industrial data.

2. Problem Statement & Industrial Need

The core problem is to address confidentiality and control over sensitive data within an organization, especially when dealing with private SOPs (Solutions of Procedures) or proprietary documents. Cloud-based AI solutions are often restricted by internet access policies and security measures that can hinder the controlled egress of confidential information.

- **Risks:**
- **Cloud AI Blockade:** The use of cloud services like AWS, Azure, or Google Cloud poses significant risks due to their open nature.
- **On-premise vs. Air-Gapped AI:** On-premises systems are more secure and can control the egress of data but may not be as accessible for external audits.

3. Proposed Solution & Architecture

- **End-to-End Technical Pipeline:**
 1. **Input:** PDF, Image, Drawing, Code
 2. **Understand:** Local OCR + Vision models
 3. **Retrieve:** Private SOPs / Manuals
 4. **Plan:** Agent creates task plan
 5. **Execute:** Local AI models and tools
 6. **Verify/ReRank:** Sandbox + evidence selection
 7. **Deliver:** Word, Excel, PPT, Code, Text
- **Key Modules:**
- **Agent Creation:** Plans -> Acts -> Verifies
- **Model Router:** Private RAG (Rag Aided Governance)

- **Multi-step Work:** Task-aware Model Router
- **Evidence-Focused:** Sandbox + evidence selection
- **Model-Agnostic:** New models plug in without redesigning the whole system
- **Open-Weight AI:**
 - No vendor lock-in
 - Local Knowledge
 - Safe Tooling
 - Sandboxed Execution

4. Key Innovations & Differentiators

- **Provable Sovereignty:**
 - Proven open technologies like Qwen, Llama, Mistral, Gemma, PaddleOCR, and FAISS ensure controlled execution without redesigning the core AI architecture.
